

Shopping Cart Integration for Mobile Commerce APP Builders

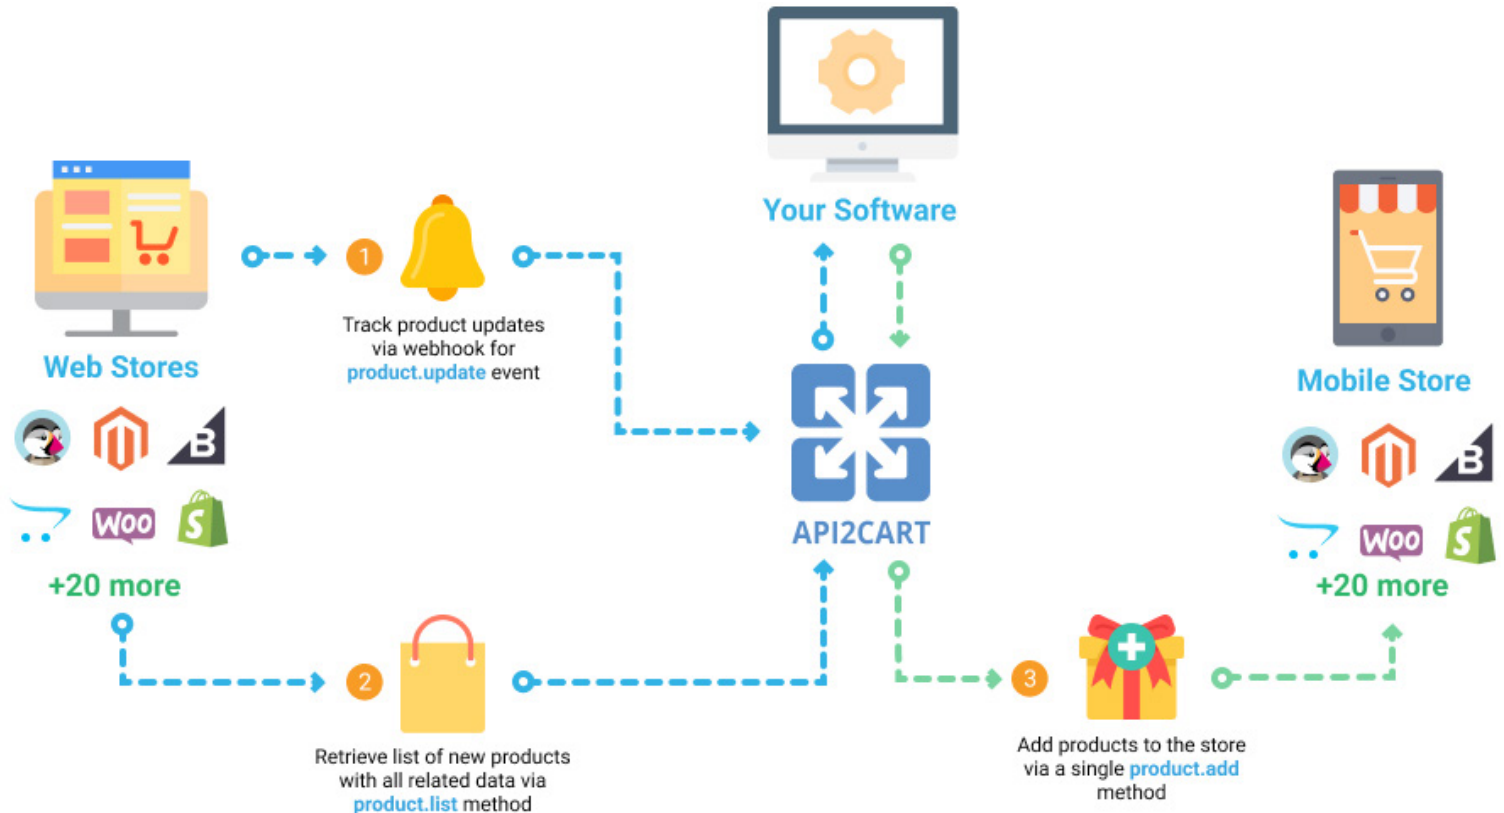

Unified approach

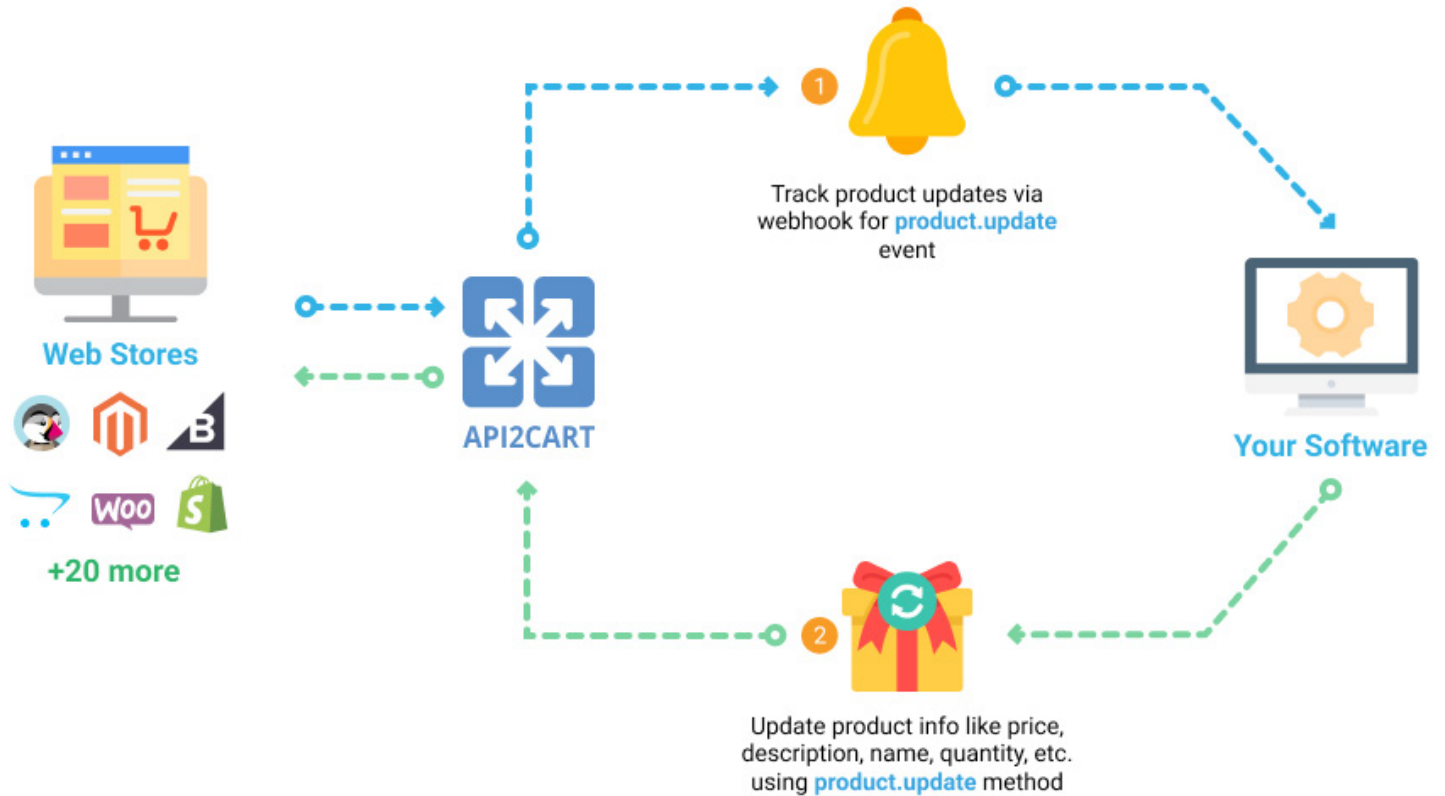

USE CASES

Product data sync between web and mobile store

Seamlessly sync all product data with images, titles, descriptions, categories, etc. from the web store with the mobile store app

Track product updates

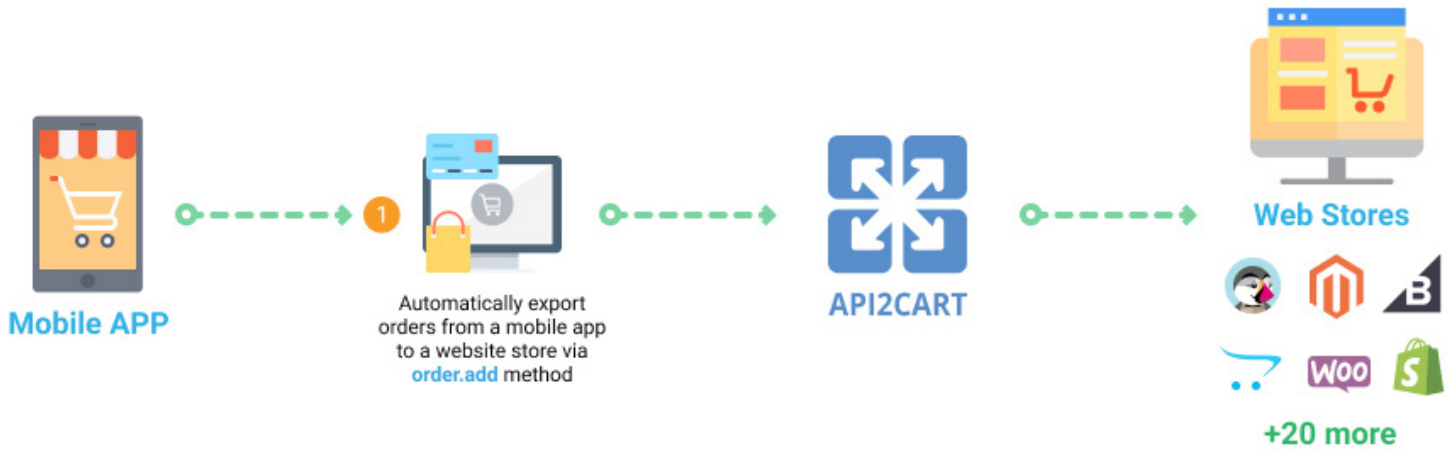

Sync inventory levels

Keeping inventory data accurate and in sync between web and mobile store is very important

Sync orders

Why Mobile APP Builders needs Integration with Shopping Platforms?

Building a mobile store app requires syncing the app with a web store, which hardly can be done without integration with shopping platforms. It ensures that all product info, customers, and orders appear in both the app and the webstore.

No matter how daunting this sounds, integrations are unavoidable. What is avoidable, however, is *more integrations* and *the problems they entail*.

API2Cart makes integration with multiple shopping carts and marketplaces so much easier, faster and cheaper. Also, API2Cart takes care of further multi-platform maintenance. You integrate with the API once, get connected to more than 35 e-commerce platforms, and don't worry about upgrading your code every time new versions of carts come out.

How shopping cart integration builds a critical link in the chain

For you, as a eCommerce app builder, merchants' e-shops is a valuable asset because that is where your software gets all needed information for the store app like orders, product info, customers, etc.

eCommerce app builders depend on integration with shopping carts to ensure mobile app is synchronized with the webstore.

In particular, integration with customer stores via API2Cart enables eCommerce app makers to do the following:

- integrate your app with 35+ shopping carts and marketplaces
- convert webstores into mobile apps easily
- sync product lists, prices, images, etc. and other store info
- sync orders in real time with webhooks
- update tracking info and order statuses

Quality of eCommerce app builders depends on its level and quality of integration with shopping carts. Integration means tying your application with a third party, so should something go wrong and an information loss or distortion occurs, and the whole lot of integrated processes will go on the blink. The consequence of this will be, that first your customers, and then you, will suffer losses.

The best way to integrate safely is to invest into a well-coined connection via API2Cart Unified Shopping Cart and Marketplace API. Having dealt with hundreds of integrations, our team have learned the pain points that various web and mobile applications face. With these in mind, **we crafted our unified API that lets your product seamlessly communicate with clients' stores, be they based on Shopify, Magento, WooCommerce, or any other shopping cart or marketplace that we support.**

API2Cart Methods for eCommerce APP Builders

API2Cart has rich capabilities for mobile app builders. We provide the whole scope of functionality to get and manage all needed info on products, orders, shipments, customers, stock levels, etc. Let's dig deeper into the methods API2cart has for such software.

Product info Sync

Use **product.list** method to get list of products along with all related info and images. Track new products added to the webstore via **webhook** for product.add event or call **product.list** method once in a while. Add products to the store via a single **product.add** method.

Update product info like price, description, name, quantity, etc. using **product.update** method.

Sync Inventory

Check and update product quantities.

Access to accurate Inventory data is vital for avoiding errors and overselling. Double check product availability by using **product.info** method, which returns items' quantity in stock. Update product quantity using **product.update** method.

Sync Orders

There are two ways to learn about new orders on stores:

- Webhook for **order.add** event

First is setting the webhooks for order.add event to get notified every time the new order is placed. Using webhooks is much more beneficial way in comparison to polling an API, as it decreases the server load, saves API requests, and provides more up-to-date info.

- **order.list** method

Another option for tracking new orders is executing **order.list** method once in a while to get list of products to be imported to your system. Filter orders by create time with *created_from* and *created_to* parameters.

Add new orders with **order.add** method.

Manage customer info

Retrieve all customers details you need via **customer.info** and **customer.list** methods.

Key Challenges of In-house Integration (Multiply by the Number of Integrations)

The integration steps mentioned above imply software vendors looking to integrate with shopping carts and other related systems will have to deal with the following challenges:

1. Time.

On average, an integration takes 4-12 weeks to develop. In this time the responsible developer will learn the platform logic and architecture, put effort into reducing the friction between the product and the system, and very likely find themselves off base a couple of times.

2. Expenses.

Be ready to pay a set sum of a few thousands of dollars plus maybe extra if the need for additional development occurs. After the integration is complete and iterated to success, it will need developer work and attention because new versions will appear and this will mean upgrades to make. Plus, your clients might request modifications and custom enhancements.

3. Human resources.

Each integration is both tons of work to do and a separate thorn in the side that never goes away after the work is done, that someone has to deal with. For better and more reliable results, you will want the someone to be dependable and expert, and that is not easy to find and hard to allocate if they are a part of your product team.

How API2Cart helps

Having dealt with hundreds of integrations, our team have learnt the pain points that various web and mobile applications face. With these in mind, we crafted our unified API that lets your product communicate with clients' stores, be they based on Shopify, Magento, WooCommerce, or any other shopping cart or marketplace that we support.

Speaking the language of benefits, API2Cart offers you to do the following:

▶ **Enhance your functionality faster**

Our unified API eliminates the need to develop separate integration for each platform. Integrate once, get the data required from the platforms needed.

▶ **Expand your market share dramatically**

Win more clients by having access to data from stores built on the shopping cart they use. Each integration means another thousands of users need you.

▶ **Reduce cost, save time**

You connect to dozens of platforms via one integration. It's months of expensive development work avoided.

▶ **Save resources**

Concentrate on what matters for your business. We take care of platform updates.

Speaking the language of tech, API2Cart lets you do the following:

1. Integrate your product with more than 30 shopping carts via one API
2. Add stores to join the 50k+ stores successfully connected by other clients of ours
3. Avoid the need to maintain each connection separately
4. Synchronize data from stores with your product real time via webhooks enabled
5. Escape mapping headaches

**Let us know if you have any questions.
We'll be happy to discuss them in any form you like.**
